US-CL-CURRENT: 210/650; 210/651, 210/652, 210/805, 210/806

ABSTRACT:

A process for removing soluble and insoluble inorganic, organic, and microbiological contaminants from a fluid stream employing a pretreatment module, a post-treatment module, a recycle stream module or any combination thereof, and a membrane module, is provided. The process provided reduces the problems associated with membrane fouling and increases contaminant removal capacity.

ABSTRACT:

The invention concerns a novel method for purifying and quantifying viral particles.

More particularly, the invention concerns a method for purifying and quantifying adenovirus by ion-exchange chromatography. The invention also concerns a method for identifying different adenovirus serotypes.

ABSTRACT:

A method for making an electrically conductive pattern, including:

(a) depositing on a substrate a metal powder composition consisting essentially of at least one metal powder, wherein the substrate is selected from the group consisting of paper and materials that are at least about 10% compressible; and

(b) densifying the composition to form a conductive pattern on the substrate.

US-CL-CURRENT: 210/798; 210/108, 210/143, 210/321.69, 210/321.79

ABSTRACT:

The invention relates to a separating system with hollow fiber membranes and an operating method. A dual backwash loop which is a pipeline connecting a top port of the said membrane assembly to a cleaning pump through a first branch and a second branch. The first branch is designed to fill a small amount of cleaning liquid into the said membrane assembly; and the second branch is designed to fill a relatively large amount of cleaning liquid in order to clean the membrane adequately. The said system operates in the following procedures: operation status, cleaning status 1, cleaning status 2, drain status, returning to the operation status. The technology of the present invention may be used to enhance the cleaning effect to the membrane system, further save water for the cleaning process, shorten the cleaning time, thus benefiting the continuous large scale industrial production and having higher efficiency.

TITLE: Supported mesoporous carbon ultrafiltration membrane and process for making the same

PUBLICATION-DATE: February 20, 2003

INVENTOR-INFORMATION:

NAME	CITY	STATE	COUNTRY	RULE-47
Strano, Michael	Wilmington	DE	US	
Foley, Henry C.	State College	PA	US	
Agarwal, Hans	Newark	DE	US	

US-CL-CURRENT: 210/483; 210/488, 210/489, 210/490

ABSTRACT:

A novel supported mesoporous carbon ultrafiltration membrane and process for producing the same. The membranes comprise a mesoporous carbon layer that exists both within and external to the porous support. A liquid polymer precursor composition comprising both carbonizing and noncarbonizing templating polymers is deposited on the porous metal support. The coated support is then heated in an inert-gas atmosphere to pyrolyze the polymeric precursor and form a mesoporous carbon layer on and within the support. The pore-size of the membranes is dependent on the molecular weight of the noncarbonizing templating polymer precursor. The mesoporous carbon layer is stable and can withstand high temperatures and exposure to organic chemicals. Additionally, the porous metal support provides excellent strength properties. The composite structure of the membrane provides novel structural properties and allows for increased operating pressures allowing for greater membrane flow rates.

The invention also relates to the use of the novel ultrafiltration membrane to separate macromolecules from solution. An example is shown separating bovine serum albumin from water. The membrane functions by separating and by selective adsorption. Because of the membrane's porous metal support, it is well suited to industrial applications.

The unique properties of the supported mesoporous carbon membrane also allow the membrane to be used in transient pressure or temperature swing separations processes. Such processes were not previously possible with existing mesoporous membranes. The present invention, however, possesses the requisite physical properties to perform such novel ultrafiltration processes.

ABSTRACT:

The present invention is a system (or apparatus) and method for processing fluids, especially waste streams from nuclear power plants, and other fluid media that may be carrying valuable or useful substances, in order to collect the substances carried by such media. The system uses sequential filtering and multiple passes to concentrate the substances, which allows the system to collect virtually all of the substances of interest to the user while reducing the volume of both the unwanted materials as well as the desired materials desired without affecting the purity of the fluid after processing. Additionally, the collected substances can be processed in-place, and without requiring any thermal processing prior to disposal of unwanted substances, or for the recovery and/or reuse of valuable substances. Furthermore, the system provides other desirable features including, but not limited to, a novel multi-purpose container, and an optional means to stabilize waste through in-place solidification.

US-CL-CURRENT: 8/158; 68/18F

ABSTRACT:

An economically viable process and system for centrally processing multiple loads of laundry with minimum environmental impact. A system and method of laundering whereby successive loads of laundry may be washed while continuously providing effective soil removal comprising at least partially recycled wash water from at least one previous wash cycle. The system and the method of using the same comprises filtering wash water with at least one filter to form wash retentate and wash permeate. The use of wash permeate in successive washes provides for reuse of chemicals and water recovery. A similar arrangement may be used with regard to the rinse water. Advantageously, one embodiment of the invention provides for the use of rinse retentate as make up water in the wash loop which increases water recovery and chemical recovery. Ultimately, the invention can reduce the production of gray water and recover chemicals used in the laundering process.

NAME	CITY	STATE	ZIP CODE	COUNTRY
Bray; James W.	West Chester	OH		

US-CL-CURRENT: 210/87; 210/106, 210/321.69

ABSTRACT:

An ultrafiltration system has a plurality of filter modules coupled in a parallel arrangement. The flow rate at the output of each filter module is detected. When the flow rate of a given module falls below a threshold value, that module is disconnected from the ultrafiltration system and automatically coupled into a regeneration circuit so that the filter module can be cleaned. Once regenerated, the filter module is recoupled into the ultrafiltration system. If the regeneration circuit is already in use when a filter module is detected to be in need of regeneration, that module is placed in a queue for regeneration once the regeneration circuit is free, and all other modules previously placed in queue have been regenerated. While awaiting regeneration, the filter modules are kept in service in the ultrafiltration system.

TITLE: Dynamic self-cleaning filter for liquids

DATE-ISSUED: June 19, 1979

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Sawyer; Harold T.	Pacific Palisades	CA		

US-CL-CURRENT: 210/137; 210/321.67, 210/321.69, 210/321.87, 210/414, 210/785

ABSTRACT:

A continuous self-cleaning filter for liquids has an outer resonant tube concentrically mounted around an inner composite tube in spaced relationship providing an annular chamber between them. There is an inflow at one end of the annular chamber for the liquid and an outflow at the other end for residual concentrate. The inner composite tube has an outlet at one end for clear effluent and a closed opposite end. A relatively thin walled perforate liner enveloped in a filter blanket comprises the composite tube. For constantly cleaning the filter blanket a sonic sinusoidal wave inducing transducer is affixed to the exterior wall of the outer resonant tube at an antinodal point, thereby to excite the outer tube into a state of resonance, thereby to continuously transform the liquid to be filtered within the annular chamber into a state of intense vaporous cavitation energy thereby to implode the surfaces of the filter blanket material causing the contamination and build up residue to be continuously removed and returned to concentrate flow within the annular chamber.

COPYRIGHT 2003 DERWENT INFORMATION LTD

TITLE: Ultrafiltration membrane cleaning mechanism in water purifier - has removable cartridge with insertion opening for supplying cleaning agent to clean separation membrane accommodated in cartridge

PRIORITY-DATA: 1998JP-0230995 (August 17, 1998)

PATENT-FAMILY:

PUB-NO	PUB-DATE	LANGUAGE	PAGES	MAIN-IPC
JP 2000061463 A	February 29, 2000		008	C02F001/44

INT-CL (IPC): B01 D 65/06; C02 F 1/28; C02 F 1/44

ABSTRACTED-PUB-NO: JP2000061463A
BASIC-ABSTRACT:

NOVELTY - Separation membrane (5) is accommodated in the cartridge (4) provided detachably in flow path formed between inflow opening and outlet hole of purifier. An insertion opening (6) is formed in cartridge, for supplying cleaning agent in order to clean separation membrane.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for ultrafiltration membrane cleaning method.

USE - For removing clogged particles from ultrafiltration membrane in water purifier in waste water treatment facility.

ADVANTAGE - The cleaning of membrane is easy since cartridge has cleaning agent supply opening. Moreover cleaning process becomes further easy since cartridge is detachable. The filtration efficiency is maintained because multiple filters are used. The membrane are also replaceable. The microbes are eliminated since the cleaning liquid performs oxidative degradation of sediments adhered to membrane

DESCRIPTION OF DRAWING - The figure shows sectional view of cartridge of water purifier. (4) Cartridge; (5) Separation membrane; (6) Insertion opening.

TITLE: Cleaning - disinfecting reverse osmosis and ultrafiltration membranes - with a soln. contg. phosphoric acid, wetting agent and a per acid

PRIORITY-DATA: 1975DD-0184064 (February 7, 1975)

PATENT-FAMILY:

PUB-NO	PUB-DATE	LANGUAGE	PAGES	MAIN-IPC
DD 117352 A	January 12, 1976		000	

INT-CL (IPC): B01D 13/00

ABSTRACTED-PUB-NO: DD 117352A

BASIC-ABSTRACT:

Simultaneous cleaning and disinfection of ultrafiltration and reverse osmosis units at temps. above the freezing pt. of the solns. used, and obviating enzyme cleaning treatments, is accomplished by removing the deposits on the filtration membrane with a soln. contg. $\geq 0.1\%$ phosphoric acid as cleaning agent, $\geq 0.5\%$ of a (pref. non-ionic) wetting agent and $\geq 0.01\%$ of a per-acid, esp. peracetic acid, as disinfecting agent, with the usual pre- and post-rinsing with water. Proteinaceous deposits can be removed from the membrane by a single stage, low temp. process which does not require the use of expensive and slow-acting proteolytic enzymes, as in known processes.
